(54) Title: METHOD FOR PERFORMING GAMES

(57) Abstract: The invention relates to a method for carrying out a game of the type comprising the steps of noting written information on a writing surface (9) with the aid of a writing means (1). The writing surface is provided with a position-coding pattern and the writing means is a combined writing and reading unit, which continually reads its movement across the writing surface. The information is converted into digital signals and is sent via a communication system (10, 11) to a recipient (12) which returns feedback on the received information. Examples of games that can be performed by means of such a method are pools, lotto, betting and various other games comprising the use of pen and paper to be carried out.

WO 02/082359 A1

(84) Designated States (regional): ARIPO patent (GH, GM, KE, LS, MW, MZ, SD, SL, SZ, TZ, UG, ZM, ZW), Eurasian patent (AM, AZ, BY, KG, KZ, MD, RU, TJ, TM), European patent (AT, BE, CH, CY, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE, TR), OAPI patent (BF, BJ, CF, CG, CI, CM, GA, GN, GQ, GW, ML, MR, NE, SN, TD, TG).

METHOD FOR PERFORMING GAMES

The present invention relates to a method for performing games of the type which comprises noting, with the aid of a writing means, written information on a writing surface.

5 Background Art

When participating in different kinds of betting or games such as lotto, pools, harness racing, horse and dog racing, use is made of special preprinted coupons where the better fills in, for instance, the number of a
10 competitor on which he puts his money to be the winner, the outcome of a match between two teams, or the numbers which the better believes are to be drawn in the next drawing. Then the better must go to a special betting shop, i.e. a place taking bets, to deliver the coupon
15 which is then stamped or read in a machine, payment is made and the better gets a receipt for his participation in the game.

Several drawbacks are involved in such a betting method. For instance, coupons must be printed, which many
20 times are unique to each round of games, and must be available in special betting shops before each round of games, and the better must thus go to the betting shop to obtain the correct coupon. Moreover, the better, after filling in the coupon, must go to a betting shop before a
25 certain point of time to deliver the coupon, make the payment and get his receipt. In many cases the better does not obtain and deliver his coupons on the same occasion since, as a rule, he wants to carefully consider which alternatives are worth betting on. The latest point
30 of time for delivering the coupon is usually relatively long before each round of games owing to the limited opening and closing hours of the betting shop, the administration of coupons and the like. Furthermore the betting company does not know who the better is, and in

case of a prize the better must go to a betting shop with his signed coupon and collect the prize. Of course, these drawbacks act in a restricting manner for prospective
5 better taking part in the game and cause great time expenditure, planning and physical movement for better taking part in the game. There is thus a need for simplifying the betting method on account of the betting shop as well as the better.

10 In addition to the above-mentioned types of betting where the better bet their money on the outcome of an event such as a competition, match or lottery, there are many other kinds of party or amusement games, such as many forms of games or amusements where the participants use pen and paper to note text and/or figures. Examples
15 of such games are Sinking ships, Tick-tack-toe, Pictionary, Bingo etc. These games require that the participants, who can be two people or more, be positioned close to each other during the game since a high degree of interactivity between the participants is
20 necessary. It goes without saying that this restricts the possibilities of performing the games.

Brief Description of the Invention

25 The present invention aims at obviating drawbacks and restrictions of games of the type mentioned by way of introduction and providing a method for performing games and providing amusement, in which the possibilities of performing the game increase and the geographical location of a participant is of no significance. At least these objects are achieved by a method according to claim
30 1.

35 Within the scope of claim 1, the invention can be worked in different ways and applied to many types of games and amusements. It is to be understood that the term writing and reading unit is to be interpreted in a wide sense, and the unit can in some cases serve as a pure input means that does not leave any legible writing, but only records the movement across a surface.

Examples of writing and reading units and position-coding patterns that are usable for carrying out the method are disclosed, for instance, in Applicant's own Patent Applications WO 00/73983, WO 01/16691, WO 5 01/26032, WO 01/26039, WO 01/48591, WO 01/48654, WO 01/48678 and WO 01/48685 which are incorporated herewith by reference.

According to a preferred embodiment of the invention, the written information is temporarily stored 10 in the writing and reading unit and the user can select the point of time for sending the written information, for instance, by actuating a send button on the writing and reading unit or by moving the writing and reading unit across a specific place on the writing surface which 15 has a specially designed position-coding pattern which is reserved for the purpose and triggers the writing and reading unit to send on the information.

The recipient can, at least in a first step, be, for instance, a computer, a PDA (Personal Digital Assistant) 20 or a mobile phone. The transmission can take place wirelessly by means of e.g. IR light or radio waves, such as Bluetooth®, but could also take place by a cable, electrically or optically. From this first receiving unit, the information can be forwarded via, for instance, 25 the stationary telephone network, the mobile telephone network, the Internet or a computer network to, for instance, a betting company, an opponent or a computer unit where the appropriate software is available.

In an embodiment of the invention according to claim 30 2, the method is used to bet on the outcome of events, such as competitions, matches and lotteries, optionally in combination with the betting of money. According to the invention, this can be carried out by filling in coupons which are preprinted on a sheet of paper, or some 35 other, preferably writable surface which has the specific position-coding pattern. The coupons can be printed separately in a conventional manner, in which case the

participant has to fetch the coupons from a betting shop. The coupons can, however, also be printed in and distributed by newspapers along with, for instance, match programs. Then it is possible to let the position-coding pattern be unique and identifiable to different newspaper publishers. In this way, the betting company can read out which newspaper has reached the largest number of participants. The coupons may, however, also be downloaded electronically via e.g. the internet or e-mail.

Identification of the participant can conveniently take place by means of the writing and reading unit which can be designed to send a unique identification signal, e.g. in form of a number combination, connected to the participant and/or the writing and reading unit. This can be achieved for example by an identification signal which is sent automatically from the writing and reading unit together with the transmitted information, or by a PIN-code which is entered by the participant. Besides identifying the participant, the identification signal may be utilized for encryption of the sent information between the participant and the recipient, e.g. a betting company.

Moreover, the payment for participating in the game can suitably take place via a betting account which the participant has in the betting company and which he can order to be charged via the writing and reading unit. Moreover a possible payment of prize can be made to such a betting account. However, it would also be possible to charge the costs to a Telecom operator to which the writing and reading unit is connected. Regarding different methods of payment, reference is made to PCT/SE01/02503. Thanks to the identification via the writing and reading unit, it is possible for the betting company to pay a prize directly to the participant's account.

The preprinted coupons can suitably be designed in a conventional manner with special boxes intended for filling in winners, match results, numbers and the like. The transferring of the information can be carried out in essentially two ways. On the one hand, the position-coding pattern in the box that has been filled in can itself be the carrier of the information, i.e. the position-coding pattern in the box in question is especially reserved for a specific character or alternative, for instance a number in a lottery or the outcome of a match such as 1 x 2 in connection with results pool. However, the information could also be identified by interpretation of the characters written by the participant in a certain area, and the position-coding pattern is used to identify where on the coupon the characters have been written.

After the information has been forwarded, it is processed by the betting company in question, for instance by automatic data processing where the participant is identified, and by checking that everything has been correctly filled in and, where appropriate, that everything is in order as regards payment. This may also comprise that the betting company checks with, for instance, a bank or credit card company whether the participant can be charged. As a preferred alternative, a confirmation is then sent to the participant, for instance via his mobile phone, PDA or computer. It may then be convenient that the participant then has to accept the confirmation from the betting company before the game is finally recorded and becomes binding for both parties. The confirmation and the subsequent acceptance may then serve as a receipt for the participant to later prove his betting.

In an alternative embodiment of the invention according to claim 9, it will be possible to play party or amusement games against one or more additional opponents or against stored software by writing or

drawing, using the writing and reading unit, on a writing surface provided with a position-coding pattern, for instance a sheet of paper. The participant and any opponents and/or optional software need not be positioned
5 in the same place, but the game can be carried out by telecommuting as pure amusement at their leisure, while waiting in a line or in a waiting room or while traveling. Like in the betting method described above, the writing and reading unit reads how it is being moved
10 across the sheet of paper. The information is digitized and sent by wire or wirelessly to, for instance, a mobile phone, a PDA or a computer. Then the information can be sent on to a corresponding receiving unit of an opponent where the information is presented to him. However, the
15 game could also take place locally, involving only the participant's receiving unit and involving an opponent which is positioned in the same place, and in that case the receiving unit is used as a display for both participants. However, the play could also take place
20 involving computer software stored in the receiving unit. The writing and reading unit can also be used as a pointer for moving parts of the game appearing on the display.

Conceivable types of game that are suitable for this
25 alternative method of playing are all those where pen and paper are normally used to carry out the game, such as Pictionary, Sinking ships, Bingo and crosswords. For instance, it would be possible to provide blocks or pads where different kinds of game are collected and
30 preprinted on a sheet of paper with a position-coding pattern for use as amusement while waiting or the like. However, it would be possible to apply this method also to other kinds of amusement games where pen and paper are normally not used. As an example, mention can be made of
35 quiz games where the participant receives a question via the display, a playing card or a newspaper, and by marking an alternative on the playing card, in the

newspaper or on a neutral sheet of paper and sending the answer to the receiving unit, he will receive immediate feedback whether the answer was correct or not.

Brief Description of the Drawings

5 In the drawings

FIG. 1 is a schematic sectional view of a writing and reading unit which is usable for carrying out a method according to the invention,

10 FIG. 2 is a schematic illustration of how to carry out a first embodiment of the invention, and conceivable equipment therefor, and

FIG. 3 is a schematic illustration of how to carry out a second embodiment of the invention and conceivable equipment therefor.

15 Description of Preferred Embodiments of the Invention

Reference is first made to Fig. 1, which shows a conceivable embodiment of a writing and reading unit 1. This has mainly the shape of a pen with a pen point 2, conveniently a ball point pen with an ink cartridge 3. A camera 4 with a lens is directed downwards at the side of the pen point 2. A pressure sensitive sensor activates, when the pen point 2 is in contact with the writing surface, the camera to register the movement over a position-coding pattern on the writing surface across which the pen is moved. The camera communicates with a processor 5, in which the camera image is digitized and interpreted, and the image data is then stored in a memory 6. When the desired amount of written information has been stored in the memory, this can be transmitted at an optional time and be sent on wirelessly via a transmitter 7 which in a preferred embodiment is a so-called Bluetooth® transmitter. 8 designates a battery, which supplies electric current to the writing and reading unit.

35 Then reference is made to Fig. 2, which illustrates a possible way of carrying out a method according to a first embodiment of the invention. In this embodiment, a

person is to participate in a game and bet money on guessing the outcome of an event such as a competition, match or lottery. To this end, a preprinted coupon 9 is used. This is in a conventional manner provided with e.g. text for the matches on which a bet is to be made and boxes where the participant marks the chosen alternative, for instance the winning team or draw. However, the coupon is special in so far as it is provided with a position-coding pattern on at least the writing surfaces that are to be filled in, and this position-coding pattern is read in connection with the filling in by means of the writing and reading unit 1. The information about the selected alternatives is thus stored in the memory 6 of the writing and reading unit, and when the coupon has been completed, the participant can choose to send the information, for instance by marking a specific send box on the coupon. The transmitter in the writing and reading unit is thereby actuated and the information is sent via a suitable communication system to a recipient, for instance a betting company. The communication system can be of an optional kind and is in the shown example a mobile telephone system, which is illustrated by a mobile phone 10 which sends the information to a central server 11, from which the information is passed on to a local server 12 of the betting company. There the received information is processed in a conventional, and preferably automatic, manner, which conveniently comprises identifying the participant, for instance by a unique identification signal from the writing and reading unit 1, checking that the coupon is correctly filled in and that everything is in order as regards payment for participating in the game. If everything is in order, the betting company sends a confirmation in the opposite direction, which suitably is shown on the display of the mobile phone. Before the game is finally recorded, it is convenient for the participant to accept the particulars in the

confirmation. The acceptance can take place by means of the writing and reading unit 1 as well as direct via the mobile phone 10. Such a method for carrying out a game involves a number of advantages. The participant has
5 documentation regarding the performed game by means of the filled-in coupon and, besides, a receipt by means of the confirmation from the betting company, which can be stored in the mobile phone or transferred to another medium, such as a computer, or a paper printout. The
10 betting method further makes it easier for the participant to participate in the game since the coupon need not be delivered to a specific betting shop. There is also the possibility of an extended deadline for participating in the round of games until a time closer
15 to the round of games or the drawing.

Fig. 3 shows an alternative method for performing games according to the invention. This embodiment comprises party or amusement games where a participant plays against one or more additional participants,
20 optionally in combination with software, or the participant plays merely against software. In the example illustrated, two participants are playing against each other, and an advantage of the method is that the participants need not be situated at the same place. Each
25 of the participants has a writing and reading unit 1 of the type described above and a writing surface, suitably in the form of a sheet of paper 14 which is provided with a position-coding pattern and which, according to the form of game, can optionally be essentially blank or have
30 the form of a preprinted playing board. The method is well suited for such kinds of game which comprise a great measure of interactivity between the participants or a participant and software and which besides comprise drawing figures, marking e.g. boxes or writing
35 text/numbers/symbols by means of a pen. The writing and reading units 1 of both participants communicate with a convenient communication system, which in the Figure is

illustrated by two mobile phones 10 which in turn communicate with each other, preferably via a server 11. As the game proceeds, the participants act alternately by writing using the writing and reading unit 1 and
5 sending the information via the mobile phones 10, the result of the writing being illustrated to the other participant on the display of his mobile phone or by acoustic signals. The practical performance of a game according to the method can in practice be varied almost
10 infinitely. Instead of mobile phones, use can be made of, for instance, a computer or a PDA which both have a larger display than a mobile phone, thus improving the possibilities of illustrating the game as it proceeds. The method may also comprise interaction with some form
15 of game software which can be stored either locally with a participant or centrally with a game company. Such software also allows the performing of games using pen and paper with only one participant against software. Below follows some examples of kinds of games which can
20 be performed by means of a method according to the invention.

Sinking ships: The game is performed against software, locally or centrally stored, or an opponent. The ships are positioned by means of the writing and
25 reading unit and can optionally be stored in software, or a playing board is provided by the software in which the ships have been positioned randomly. During the game, shots are marked in optional boxes and hits or misses are marked optionally by the opponent or the software, for
30 instance by means of acoustic signals.

Pictionary: This kind of game implies that two or more participants are to illustrate a word by means of a drawing and another participant is to guess the intended word as quickly as possible. The word can conveniently be
35 given randomly by software. This kind of game is facilitated if the writing and reading unit is designed so as to send the read information continually via the

communication system without intermediate storage of the information.

5 Crosswords: A preprinted crossword in interaction with software gives the participant the possibility of being rapidly corrected and getting immediate feedback whether the crossword is correctly filled in. However, correction requires that the writing and reading unit or the software can interpret the characters written in each box.

10 Bingo: The participant has preprinted bingo coupons and receives numbers via a communication device such as a mobile phone. As the numbers are being presented, the participant marks any hits on the coupon. When a full row of numbers has been obtained, the participant causes the
15 information to be sent to the bingo operator which checks whether the row is correct, the identity and the like and pays out a prize if any.

20 Voting: To establish various hit lists of different kinds, for instance music, artists, movies. Can be combined with some form of lottery for the participants. When carrying out the voting, the identity of the writing and reading unit should be recorded so that it can be used for voting only once.

CLAIMS

1. A method for performing games of the type which comprises the steps of noting, with the aid of a writing means, written information on a writing surface,
5 c h a r a c t e r i z e d by the further steps of;
 using a writing surface provided with a position-coding pattern,
 using as the writing means a writing and reading unit, which detects the movement of the writing and
10 reading unit across the writing surface by continually reading the position-coding pattern on the same,
 converting the information detected by the writing and reading unit into digital signals, and
 transmitting the digitized information via a
15 communication system to a recipient.
2. A method for performing games as claimed in claim 1, wherein the writing and reading unit, in addition to detecting the movement across the writing surface, also leaves written information, which is legible to the
20 user's eye, on the writing surface.
3. A method for performing games as claimed in claim 1 or 2, wherein feedback on the transmitted information is received from the recipient via the communication system.
- 25 4. A method for performing games as claimed in any one of the preceding claims, wherein, as the writing surface, use is made of preprinted coupons for betting on the outcome of an event such as a competition, match or drawing of numbers.
- 30 5. A method for performing games as claimed in claim 4, wherein money is bet on the outcome of the event.
6. A method for performing games as claimed in any one of the preceding claims, wherein the coupon is completed and the information is stored in the writing
35 and reading unit before the information is forwarded.

7. A method for performing games as claimed in any one of the preceding claims, wherein a confirmation is received from a betting company which arranges the game.

8. A method for performing games as claimed in claim 5 7, wherein the participant gives his acceptance of the confirmation from the betting company before the game is registered as being valid.

9. A method for performing games as claimed in any one of claims 1-3, wherein the game is performed as a 10 party game or amusement game against one or more opponents and/or software.

10. A method for performing games as claimed in any one of claims 1-3 or 9, wherein the writing and reading unit sends the information continually to the receiving 15 unit without intermediate storage.

11. A method for performing games as claimed in any one of claims 1-3 or 9-10, wherein a game operator provides blocks or pads with different games that can be used as entertainment by a participant as desired.

20 12. A method for performing games as claimed in any one of the preceding claims, wherein the writing and reading unit sends a unique identification signal which is utilized of the recipient for identifying the participant and/or the writing and reading unit.

25 13. A method for performing games as claimed in claim 12, wherein the information between the participant and the recipient is sent encrypted by utilizing the unique identification signal of the writing and reading unit.
